

How to (not) reduce and analyze MUSE data

Felipe Gran M.

Ph.D. student PUC/MAS, Chile

Survey Science Coffee @ ESO HQ

25.03.2019

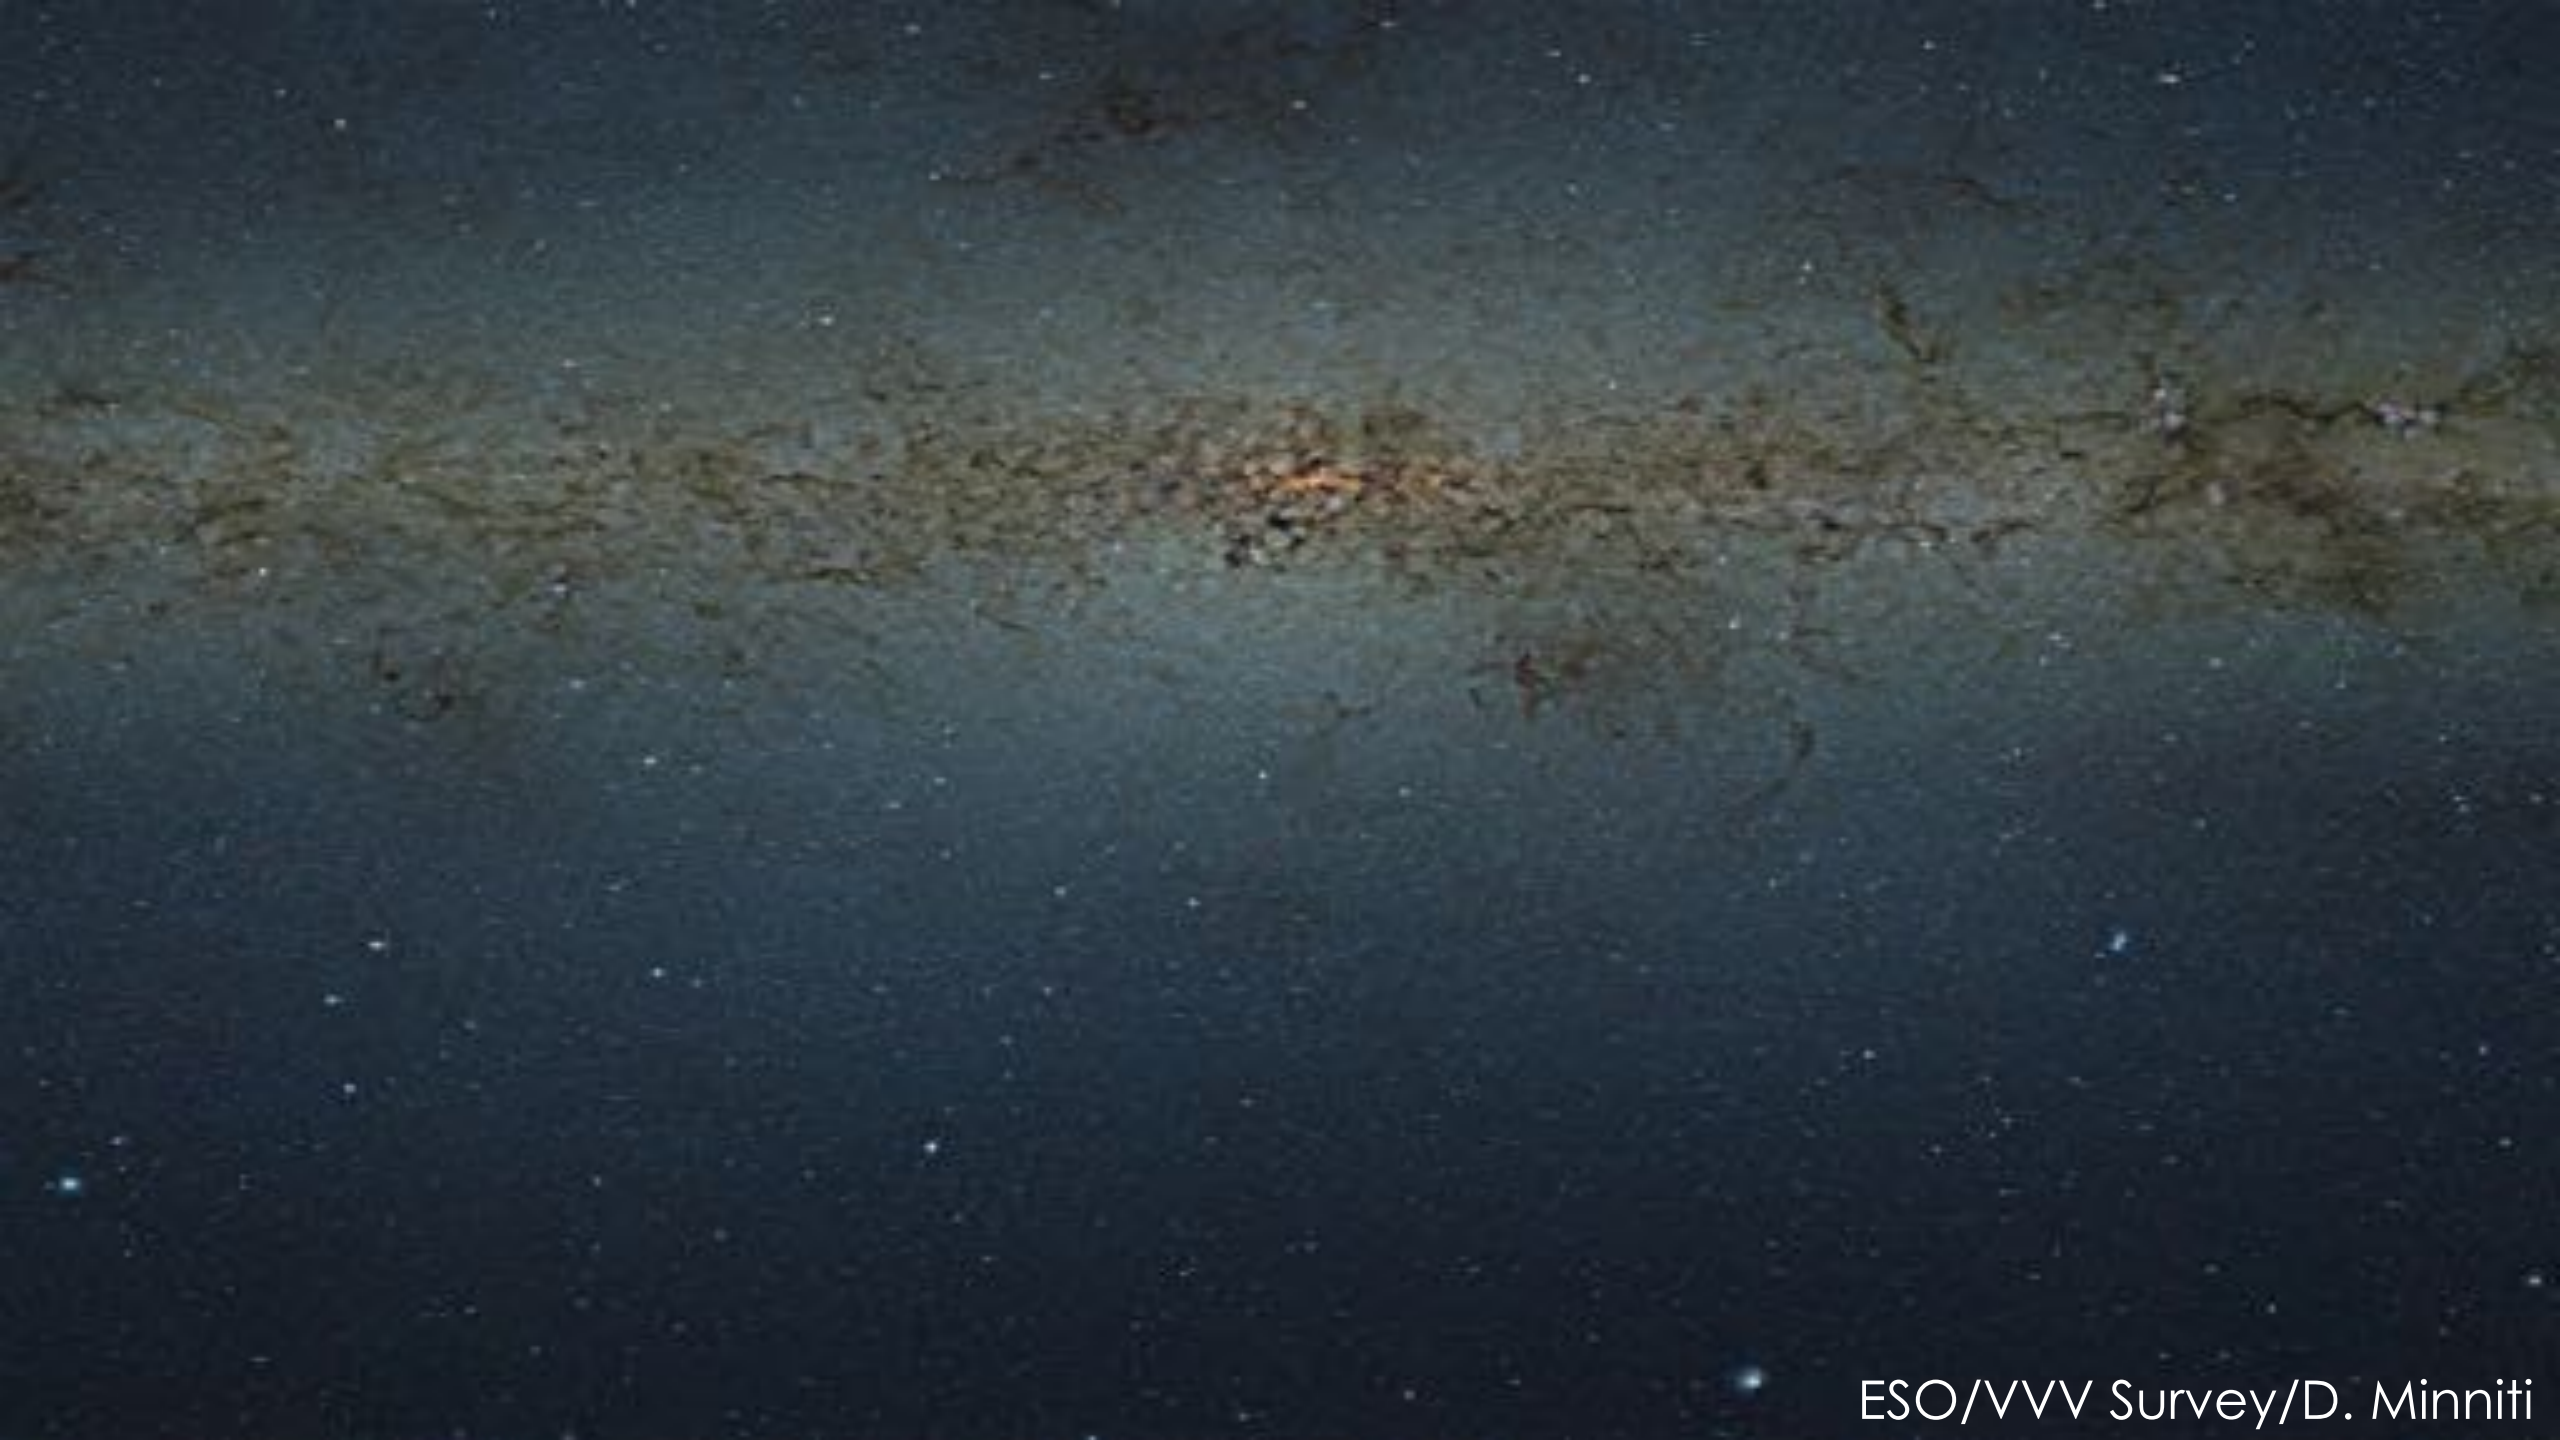

~~How to (not) reduce and analyze MUSE data~~

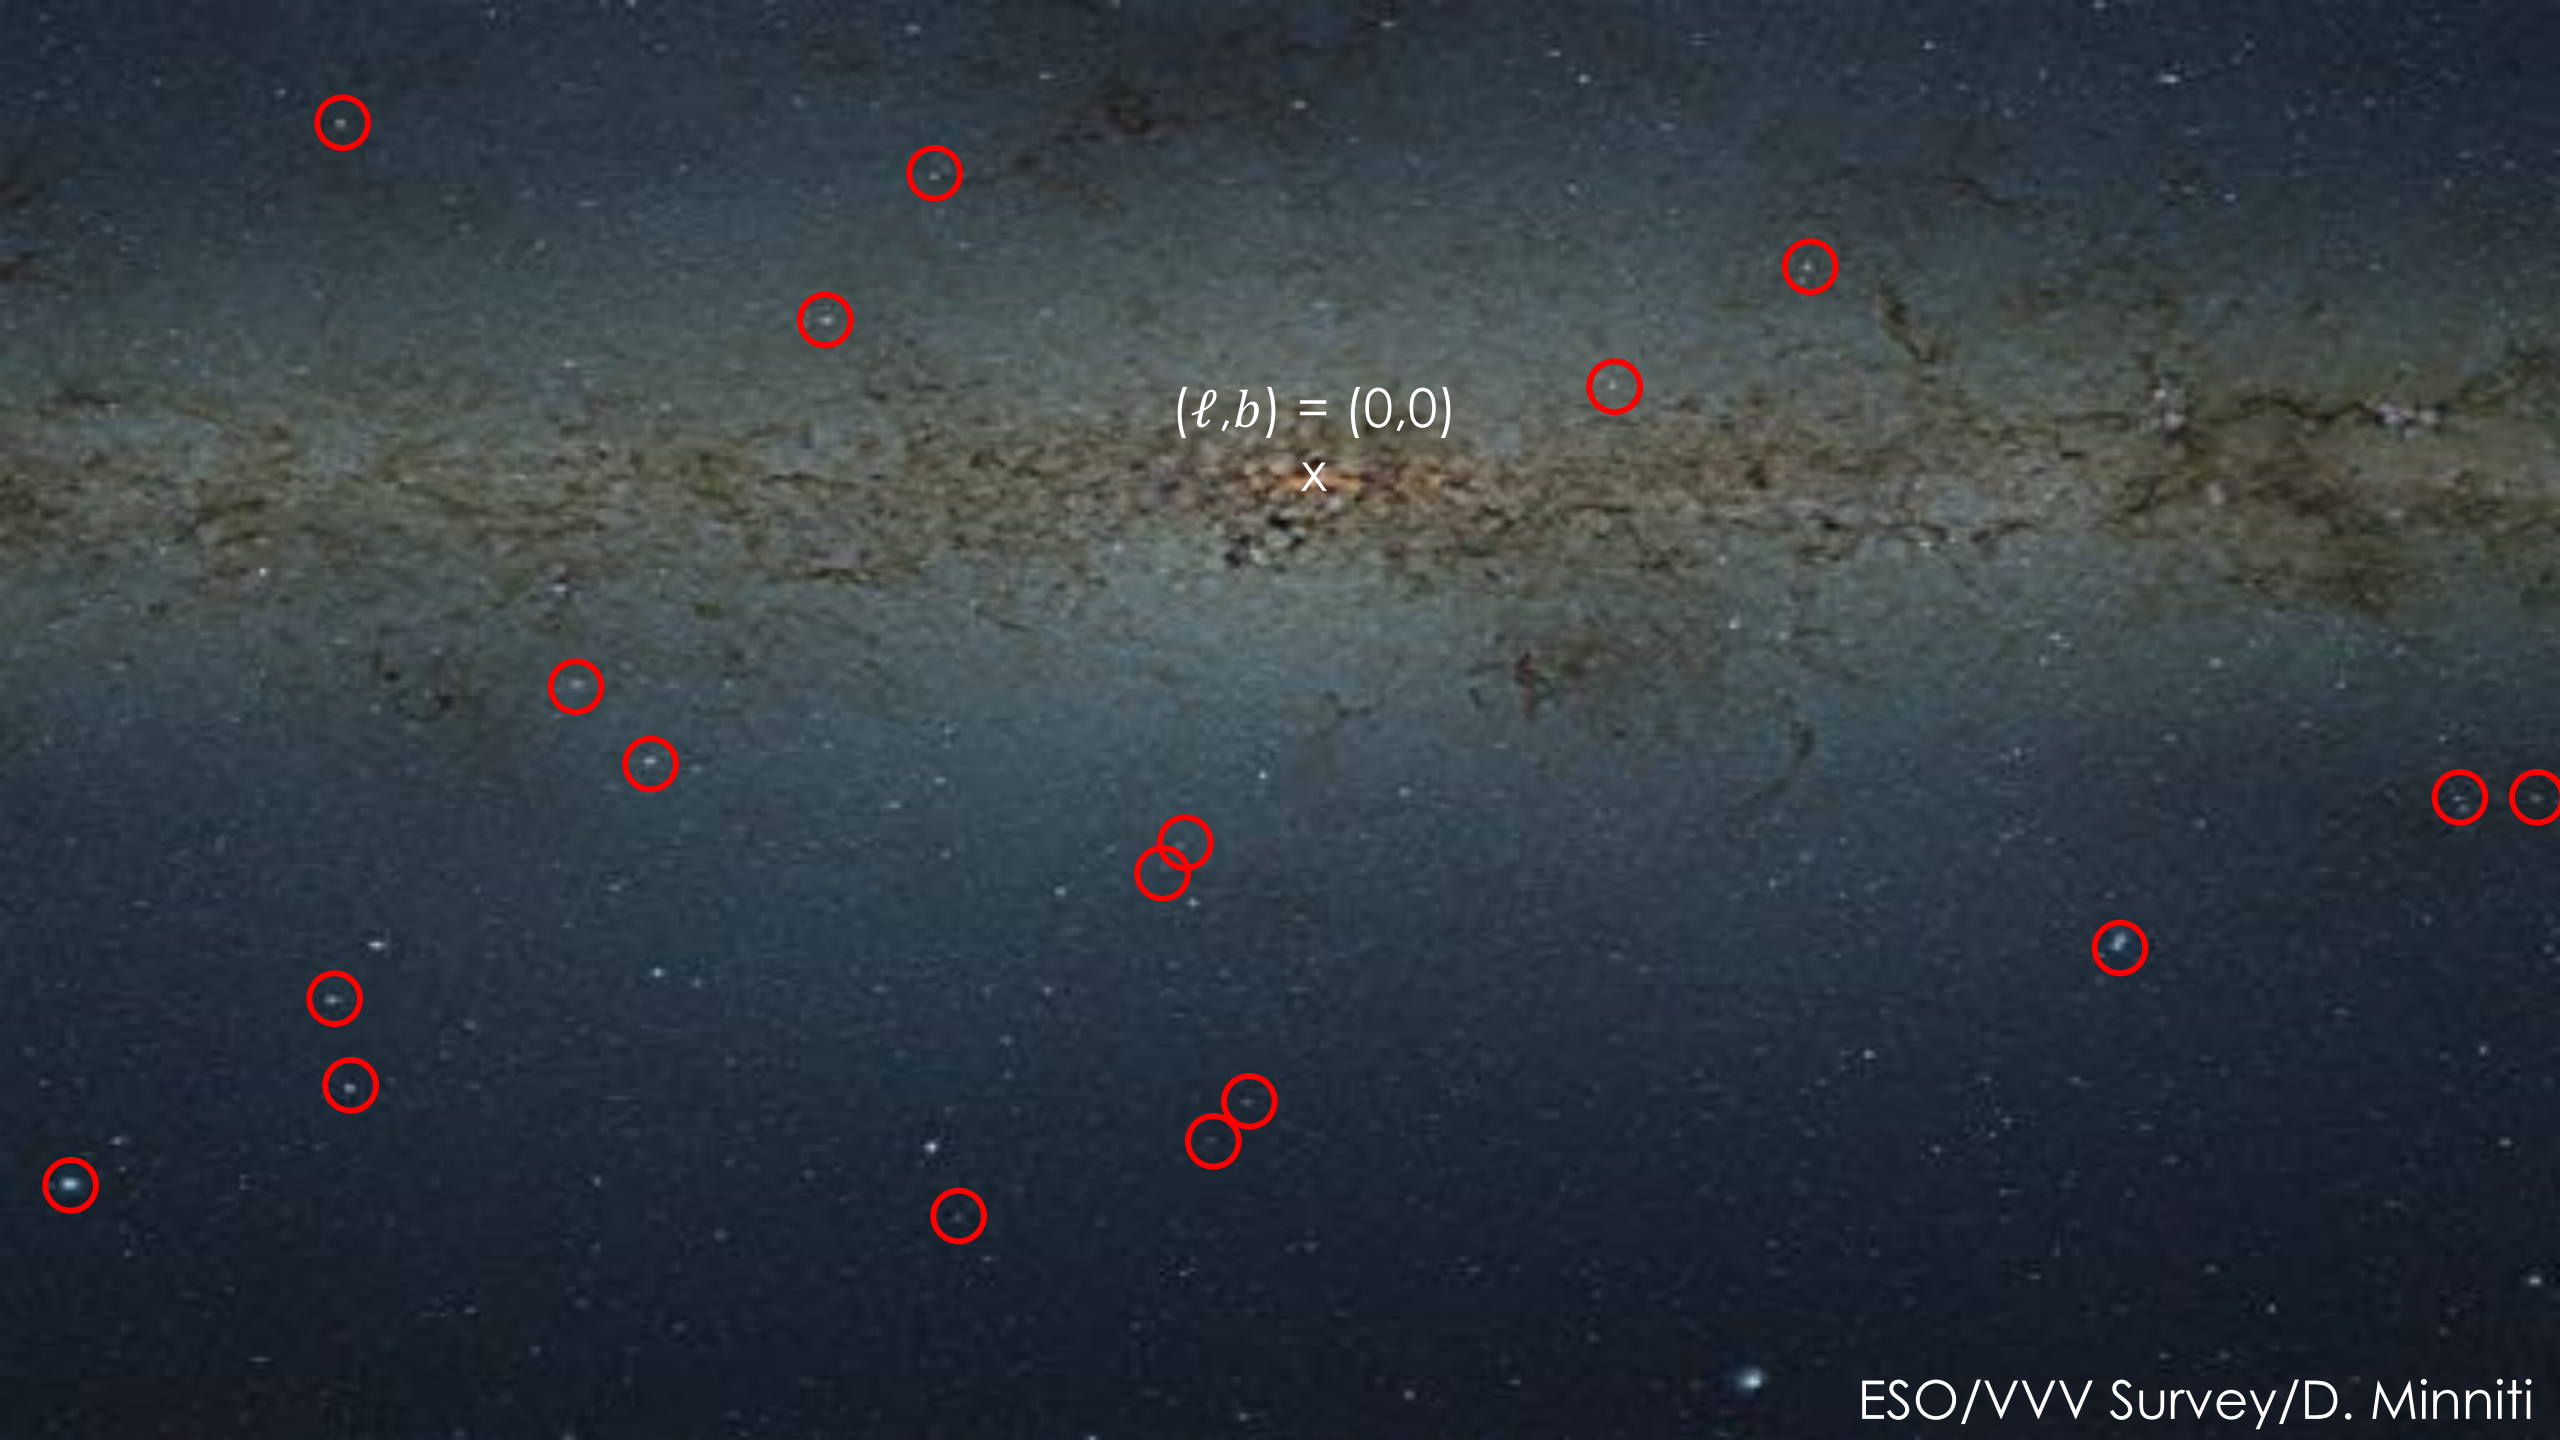

Why am I here and what did I do for the last 3 months?

Felipe Gran M. + constant feedback and help of E. Valenti

Context: searching for new globular clusters

Thanks to the **wide-area** photometric surveys, the number of globular clusters has risen exponentially in the last decades.

Technical motivation: “short term student”

- ★ Learn how to **reduce** MUSE datacubes
- ★ Perform a careful spectra extraction by using **PSF-fitting** algorithm
- ★ Deriving stars **kinematics** and **metallicity** through cross-correlation technique and equivalent width determination

Technical motivation: “short term student”

- ★ Learn how to **reduce** MUSE datacubes
 - ★ Follow the adapted MUSE Pipeline Manual: GoMUSE © TM
- ★ Perform a careful spectra extraction by using **PSF-fitting** algorithm
- ★ Deriving stars **kinematics** and **metallicity** through cross-correlation technique and equivalent width determination

Technical motivation: “short term student”

- ★ Learn how to **reduce** MUSE datacubes
 - ★ Follow the adapted MUSE Pipeline Manual: GoMUSE © TM
- ★ Perform a careful spectra extraction by using **PSF-fitting** algorithm
 - ★ Using Sextractor/PSFex perform photometry on every λ –slice
- ★ Deriving stars **kinematics** and **metallicity** through cross-correlation technique and equivalent width determination

Technical motivation: “short term student”

- ★ Learn how to **reduce** MUSE datacubes
 - ★ Follow the adapted MUSE Pipeline Manual: GoMUSE ©™
- ★ Perform a careful spectra extraction by using **PSF-fitting** algorithm
 - ★ Using Sextractor/PSFex perform photometry on every λ –slice
- ★ Deriving stars **kinematics** and **metallicity** through cross-correlation technique and equivalent width determination
 - ★ Beginner's Guide to Python:

```
from specutils.fitting import fit_generic_continuum

from PyAstronomy.pyasl import crosscorrRV as CC
from specutils.analysis import equivalent_width

from joblib import Parallel, delayed
from specutils import Spectrum1D
```

GoMUSE vPSFex

This repository contains scripts to perform PSF photometry on MUSE slices. Heavi

Intended usage

Here you can find an example of the usage: [Jupyter Notebook](#).

The execution of the program occurs in a working folder, that at the beginning contains:

```
default files for SExtractor/PSFex
Raw datacube
Field of View images (White,V,R,I)
GoMUSEvPSFex.py
```

The python programme (**GoMUSEvPSFex.py**) can be divided in two major branches: "User parameters" and "Main features". The last branch also is divided into three major phases that the first two can be operated separately:

- Phase 1: Perform PSF photometry on VRI FoV images and create the catalogs.
- Phase 2: Separate slices using MissFITS to prepare to Phase 3.
- Phase 3: After Phase 2, iterate over all the MUSE slices and perform PSF photometry creating individual catalogs.

After a successful run of the script, there will be three (VRI) catalogs on **cmds_output/** and catalogs for each slice on **slice_catalogs/**. Each catalog will contain a unique star ID, (X,Y) and (RA,Dec) coordinates, magnitudes/fluxes for the CMD/slices and three diagnostic quantities (flags,fwhm, and SNR).

Expected goals: Valenti et al.2018

Expected goals: Zoccali et al. 2014

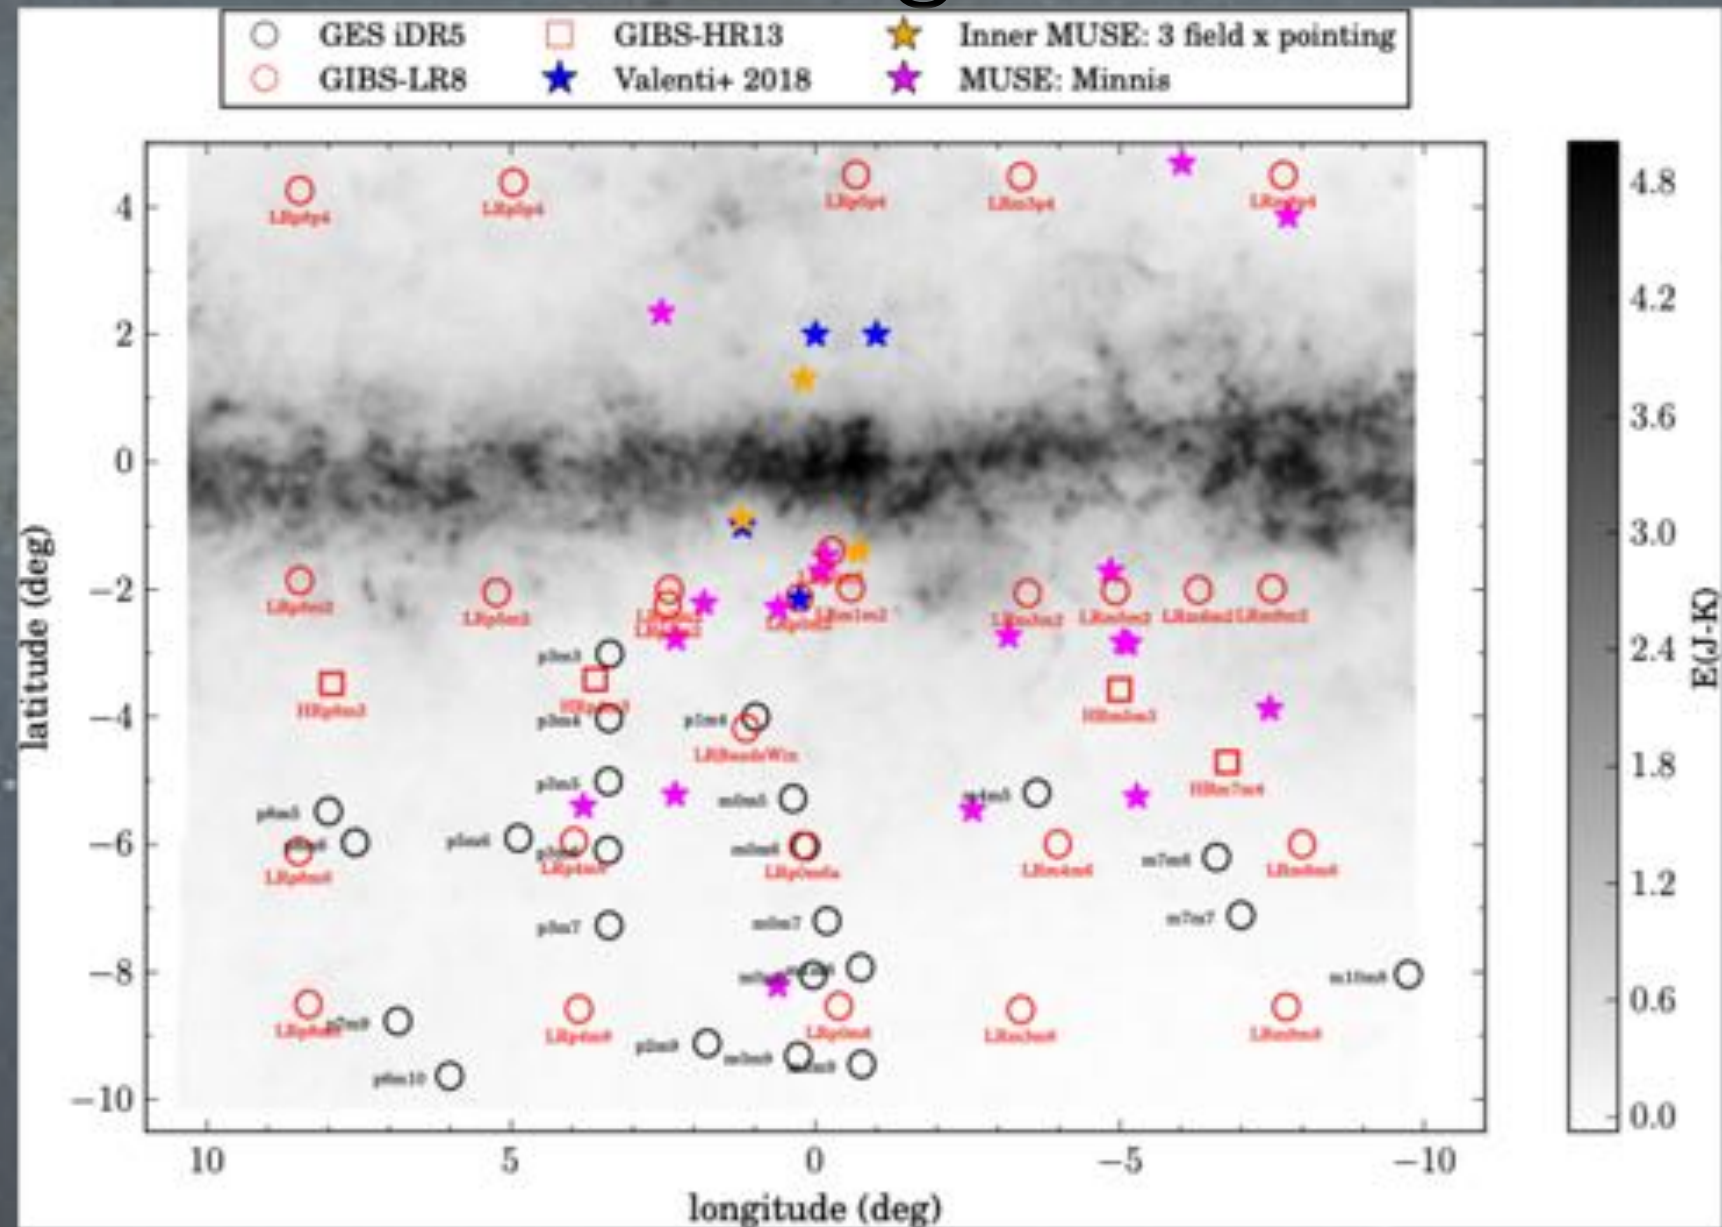

Mean radial velocity surface

Radial velocity dispersion surface

Real goals:

Future work: “No time to finish it”

- ★ Finish the analysis for the remaining fields:
derive RV and calculate CaT equivalent widths.

Future work: “No time to finish it”

- ★ Finish the analysis for the remaining fields:
derive RV and calculate CaT equivalent widths.
- ★ Cross-match the final catalog (RA,Dec,V,R,I,RV,EW) with Gaia DR2+VVV to obtain 5D phase space information.

```
for catalog, tile in zip(data, tiles):  
  
    stilts1 = 'java -jar stilts.jar cdsskymatch cdstable=I/345/gaia2 find=best radius=1 in=%s ' % catalog  
    stilts2 = 'ifmt=ascii ra=ra dec=dec out=../tiles/VVV_GaiaDR2_%s.csv ofmt=csv' % tile  
  
    print('Actual tile %s' % tile, end='\r')  
  
    os.system('%s %s' % (stilts1, stilts2))
```

Future work: “No time to finish it”

- ★ Finish the analysis for the remaining fields:
derive RV and calculate CaT equivalent widths.
- ★ Cross-match the final catalog (RA,Dec,V,R,I,RV,EW) with Gaia DR2+VVV to obtain full 6D phase space information.
- ★ Carefully correct some of the spectra:
PSF model not converge or bad measurement.

Thank you for your attention!
